Óscar Romero Quincoces

Quantitative analyst in financial markets. Research, trading experience and AI tools for markets.

romequinco@gmail.com romequinco.github.io linkedin.com/in/oscarromeroquincoces github.com/Romequinco
Bilbao, Madrid or remote

Three years executing equities on mandate on a trading desk, and now building AI products for markets: LLM agents and RAG systems that cite their sources, check their own figures and never give investment advice. Founder of Triarii Consulting; currently on the MIAX master's at Instituto BME.

Work

2026–now — **Founder, Triarii Consulting**
AI and finance consultancy in Madrid. Auguria and STATOR come from here.

2025–now — **Head of AI and Administration, Albujón Energy**
A solar company. I built the Telegram bot and the RAG over internal documents that the team uses every day.

2022–2025 — **Execution Trader, equities**
At a private investment office: block execution on mandate, intraday trading and risk control.

2022–2026 — **Managing Director, The Sole Club**
A shop in Bilbao. I ran the P&L for four years and set prices and stock rotation from sales data.

Selected projects

In production — **Auguria**
Market dashboards, a factor screener across more than 1,000 assets, four AI agents and a daily closing briefing by web and email. A deterministic filter blocks any buy or sell wording. I built it on my own: about 1,070 commits in five months and around 900 tests.

Part of Auguria — **Auguria Studio**
The studio inside Auguria where agents produce short educational videos and carousels. No figure is typed in by hand: every number on screen is recalculated from the data before it is rendered.

Live demo — **Briefly**
Four minutes of audio on how your stocks closed. It also reads your PDFs, charts and broker screenshots, and answers out loud in 6.4 seconds. 232 of 232 figures trace back to their source, and not one sentence is a recommendation. 1,301 tests, €0.034 per briefing. Built in a team of 3.

Paper trading — **STATOR**
It quotes buy and sell prices continuously for illiquid BME Growth stocks, with hard risk limits, a kill switch and a hash-chained audit log with a daily timestamp. In the paper-trading session it sent 2,938 orders and none went outside its limits; the kill switch cancels everything in one second. MVP in six weeks, at Triarii.

In daily use — **Telegram task agent**
A bot in Albujón Energy's team group. It reads every message and voice note, picks out new tasks, updates and finished work, and posts a summary at 8:30 and 17:00 on weekdays, with buttons to confirm what got done. The team uses it every day.

In use — **Document systems for companies**
For five companies I took documentation spread across folders, emails and PDFs, sorted it into one ordered archive and set up an AI assistant on top, so anyone on the team can ask a question and get the answer from the company's own documents.

Personal tool — **MIAX Asesor**
It turns the master's material into a knowledge base of 105 topics and about 4,200 sub-concepts. Three specialist agents, for finance, AI and maths, and engineering, debate each question and then write a summary you can download.

Master's project	**10-K agent** It answers financial questions about 10-K reports, cites the exact source and checks every figure against XBRL, with search that mixes vectors and BM25. Accuracy went from 35% to 65% over the baseline, and it got 8 of 10 blind questions right. Team of 3.
Master's thesis	**Market regimes** A test bench with no look-ahead leaks, and the first part of my master's thesis. A simple rule won: Mahalanobis turbulence caught 16 of 17 crises. Simple models beat the complex ones.
In progress	**Stock contest** For El Concurso de Bolsa 2026. A simulator replays 452 historical windows of 23 sessions against thousands of synthetic rivals under the contest's exact scoring, so the strategy aims for the podium rather than for the highest return. Every day it sends the orders by Telegram and I place them by hand, because the rules don't allow bots. I'll publish the results after 12 November.
Ruled out	**Polymarket** An experiment on Polymarket's "Bitcoin up or down" markets. The hypothesis was momentum, and the data said no: candles repeat their colour less than half the time. The edges in my first version came from look-ahead leaks, so I shelved the bot before putting any money in.
First prototype	**IBEX 35 newsletter** The forerunner of Auguria. Every trading day at 17:35, four Claude agents (a leader, a researcher, an analyst and a writer) produced a seven-page report on the Spanish market and sent it out as an email newsletter.
Prototype	**Chatbot experiments** The tests I ran before the production Telegram bot: a backend that receives WhatsApp messages through Meta's webhook, keeps each conversation's recent history and answers with Claude.

Study

2025–2027	**MIAX master's, Instituto BME** AI and quantum computing for markets. Thesis on a multi-agent RAG system with regime detection.
2026	**Financial Advisor, Instituto BME** Recognised by the CNMV, equivalent to MiFID II.
2026	**Claude Code in Action, Anthropic** Course on building software with Claude Code.
2021–2025	**International Relations, Universidad de Deusto** Bachelor's degree, with an Erasmus at Masaryk University in Brno.

Spanish is my first language. I also speak English (B2, Cambridge First), intermediate Basque, French (B1) and Chinese (HSK 3).

Skills

Languages	Python, SQL, TypeScript, HTML
Machine learning	scikit-learn, XGBoost, PyTorch, Keras, statsmodels, hmmlearn, arch, SHAP
LLMs	Multi-agent systems, RAG, tool calling, LangGraph, ChromaDB, FinBERT, Anthropic API, Claude Code
Data and infrastructure	pandas, NumPy, PostgreSQL, Supabase, FastAPI, Next.js, Docker, Railway, Git
Markets	Backtesting without look-ahead, VaR and CVaR, copulas, fixed income, options and Greeks, market microstructure
